1. Find the radius of convergence and interval of convergence of the following power series.

(a) $\sum_{n=1}^{\infty} \sqrt[n]{n} (2x+5)^n$

Use the Ratio Test:
$$\frac{\left| \frac{(n+1)^{\frac{1}{n+1}} (2x+5)^{n+1}}{n^{\frac{1}{n}} (2x+5)^n} \right| = \frac{(n+1)^{\frac{1}{n+1}}}{n^{\frac{1}{n}}} \times \left| \frac{(2x+5)^{n+1}}{(2x+5)^n} \right|$$

To discover what the first component converges to lets assume:

$$\lim_{n \to \infty} \frac{(n+1)^{\frac{1}{n+1}}}{n^{\frac{1}{n}}} = L$$
$$(n+1)^{\frac{1}{n+1}} = L(n^{\frac{1}{n}})$$

$$(n+1)^{\frac{1}{n+1}} = L(n^{\frac{1}{n}})$$

$$((n+1)^{\frac{1}{n+1}})^{n+1} = (L(n^{\frac{1}{n}}))^{n+1}$$

$$n+1 = L^{n+1}(n^{\frac{1}{n}})^{n+1} = L^{n+1}n$$

$$n+1 = L^{n+1}(n^{\frac{1}{n}})^{n+1} = L^{n+1}n$$

$$\frac{n+1}{n} = L^{n+1}$$

$$\lim_{n \to \infty} \frac{n}{n} + \frac{1}{n} = L^{n+1}$$

$$\lim_{n \to \infty} 1 = L^{n+1} \implies L = 1$$

$$\frac{n+1}{n+1} = L^{n+1}$$

$$\lim_{n\to\infty} \frac{n}{n} + \frac{1}{n} = L^{n+1}$$

$$\lim_{n\to\infty} \ddot{1} = \ddot{L}^{n+1} \implies L = 1$$

Thus the Ratio Test produces
$$|2x+5| < 1 \implies |x+\frac{5}{2}| < \frac{1}{2}$$

$$\begin{array}{c} -\frac{1}{2} < x + \frac{5}{2} < \frac{1}{2} \\ -3 < x < -2 \end{array}$$

$$-3 < x < -2$$

Thus the radius of convergence is $\frac{1}{2}$.

We must check the endpoints -3 and -2 to see if the series is convergent on the ends.

When x = -3

The series equals
$$\sum_{n=1}^{\infty} \sqrt[n]{n} (-1)^n = \sum_{n=1}^{\infty} (-1)^n$$

The series equals $\sum_{n=1}^{\infty} \sqrt[n]{n} (-1)^n = \sum_{n=1}^{\infty} (n)^{\frac{1}{n}} (-1)^n$ Note that $n^{\frac{1}{n}}$ can be re-written as $e^{\frac{\log(n)}{n}} = (e^{\log(n)})^{\frac{1}{n}} = n^{\frac{1}{n}}$

Thus we can apply L'Hospital's to the exponential.

$$\lim_{n\to\infty}\frac{\log(n)}{n}$$

$$\lim_{n \to \infty} \frac{\log(n)}{n}$$

$$L' = \frac{\frac{1}{n}}{1} = \frac{1}{n} = 0$$

Thus as
$$\lim_{n\to\infty} n^{\frac{1}{n}} = e^{\frac{\log(n)}{n}} = e^0 = 1$$

Thus the original series just becomes the Grandeis Series at the limit, which we know to be divergent (oscillating between -1 and 1).

When
$$x = -2$$

The series equals $\sum_{n=1}^{\infty} \sqrt[n]{n}$, which as proven earlier is also divergent since the limit of $\sqrt[n]{n}$ approaches 1. Thus the interval of convergence is (-3, -2).

(b)
$$\sum_{n=1}^{\infty} \frac{(n!)^2}{2^n (2n)!} x^n$$

$$\begin{array}{l} \text{(b) } \Sigma_{n=1}^{\infty} \frac{(n!)^2}{2^n (2n)!} x^n \\ \text{Use the Ratio Test:} \\ \left| \frac{\frac{((n+1)!)^2}{2^{n+1} (2(n+1))!} x^{n+1}}{\frac{(n!)^2}{2^{n+1}} x^n} \right| = \left| \frac{x^{n+1}}{x^n} \right| \times \frac{((n+1)!)^2}{(n!)^2} \times \frac{2^n}{2^{n+1}} \times \frac{(2n)!}{(2n+2)!} \\ = x \times \frac{((n+1)n!)^2}{(n!)^2} \times \frac{1}{2} \times \frac{(2n)!}{(2n+2)(2n+1)(2n)!} \\ = x \times (n+1)^2 \times \frac{1}{2} \times \frac{1}{(2n+2)(2n+1)} \\ = \frac{1}{2} x \times \frac{n^2 + 2n + 1}{4n^2 + 6n + 2} \end{array}$$

$$= x \times \frac{((n+1)n!)^2}{(n!)^2} \times \frac{1}{2} \times \frac{(2n)!}{(2n+2)(2n+1)(2n)}$$

$$= x \times (n+1)^2 \times \frac{1}{2} \times \frac{1}{(2n+2)(2n+1)}$$

$$=\frac{1}{2}x \times \frac{n^2+2n+1}{4n^2+6n+2}$$

We know that the polynomial on the right converges to $\frac{1}{4}$ as we take the limit (split the polynomial into each numerator term over the denominator, divide by the greatest multiple of n in the numerator and all the terms should approach zero with the exception of the $\frac{n^2}{4n^2...}$ term which equals $\frac{1}{4}$).

Thus
$$\left|\frac{1}{8}x\right| < 1 \implies |x| < 8$$

Thus the radius of convergence is equal to 8.

Now we must check the endpoints of -8 and 8.

The series equals
$$\sum_{n=1}^{\infty} \frac{(n!)^2}{2^n (2n)!} (-8)^n = \sum_{n=1}^{\infty} (-1)^n \times \frac{8^n}{2^n} \times \frac{(n!)^2}{(2n)!}$$

When x = -8The series equals $\sum_{n=1}^{\infty} \frac{(n!)^2}{2^n(2n)!} (-8)^n = \sum_{n=1}^{\infty} (-1)^n \times \frac{8^n}{2^n} \times \frac{(n!)^2}{(2n)!}$ To check what $\frac{(n!)^2}{(2n)!}$ converges to we employ the Ratio Test again:

$$\left|\frac{\frac{((n+1)!)^2}{(2n+2)!}}{\frac{(n!)^2}{(2n)!}}\right| = \frac{((n+1)!)^2}{(n!)^2} \times \frac{(2n)!}{(2n+2)!} = \frac{((n+1)n!)^2}{(n!)^2} \times \frac{(2n)!}{(2n+2)(2n+1)2n!}$$

$$= (n+1)^2 \times \frac{1}{(2n+2)(2n+1)}$$

$$= \frac{1}{2} \times \frac{1}{2n+1} \times (n+1), \text{ which converges to } \frac{1}{4} \text{ as you take the limit.}$$
Thus the expression we were evaluating before as you take the limit is:
$$\Sigma(-1)^n \times 4^n \times \frac{1}{4}, \text{ which is divergent.}$$

 $\Sigma(-1)^n \times 4^n \times \frac{1}{4}$, which is divergent.

When x = 8

When x = 8The series equals $\sum_{n=1}^{\infty} \frac{(n!)^2}{2^n(2n)!}(8^n)$, which is also divergent (because if we've proven that the series is not conditionally convergent then it cannot be absolutely convergent).

Thus the interval of convergence is (-8, 8).
