Assignment 10 Problem 4

Michael Cai

April 8, 2016

4. Determine whether the following series converge or diverge. You may use any test that you find appropriate (ratio test, comparison test, alternating series test, limit comparison test, root test, integral test.) (a) $\sum_{n=1}^{\infty} \frac{(2n)!}{n!(n+1)!}$

Using the Ratio Test:

$$\lim_{n \to \infty} \left| \frac{a_{n+1}}{a_n} \right| = \frac{\frac{(2(n+1))!}{(n+1)!(n+2)!}}{\frac{(2n)!}{n!(n+1)!}} = \frac{n!(n+1)!}{(n+1)!(n+2)!} \times \frac{(2n+2)!}{(2n)!}$$

$$= \frac{n!}{(n+2)!} \times \frac{(2n+2)!}{(2n)!}$$
By the properties that factorials have:

$$=\frac{n!}{(n+2)!}\times\frac{(2n+2)!}{(2n)!}$$

$$(n+2)! = n!(n+1)(n+2)$$

$$(2n+2)! = (2n)!(2n+1)(2n+2)$$

Thus the original equation factors to:

Thus the original equation factors
$$= \frac{n!}{n!(n+1)(n+2)} \times \frac{(2n)!(2n+1)(2n+2)}{(2n)!}$$

$$= \frac{1}{(n+1)(n+2)} \times \frac{(2n+1)(2n+2)}{1}$$

$$= \frac{(2n+1)(2n+2)}{(n+1)(n+2)}$$

$$(n+1)(n+4n^2+6n+2)$$

 $=\frac{4n^2+6n+2}{n^2+3n+3}$ Because we have taken the limit, the fraction is in indeterminate form. Thus we apply L'Hospital's Rule (denoted $L^x()$)

$$L'(\frac{4n^2+6n+2}{n^2+3n+3}) = \frac{8n+6}{2n+3}$$
$$L'' = \frac{8}{2} = 4 > 1$$

$$L'' = \frac{8}{3} = 4 > 1$$

Because the r is greater than 1 the series diverges. (b) $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2+2n+1}$

(b)
$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2+2n+1}$$

This series is similar in form to $\frac{1}{n^2}$ so I will prove that it converges absolutely by using the Limit Comparison Test.

Let
$$a_n = \frac{1}{n^2}$$
 and $b_n = \frac{1}{n^2 + 2n + 1}$

Let
$$a_n = \frac{1}{n^2}$$
 and $b_n = \frac{1}{n^2 + 2n + 1}$

$$\lim_{n \to \infty} \frac{\frac{1}{n^2}}{\frac{1}{n^2 + 2n + 1}} = \frac{n^2 + 2n + 1}{n^2} = 1 + \frac{2n}{n^2} + \frac{1}{n^2} = 1$$
Thus $b_n = \frac{1}{n^2 + 2n + 1}$ by the property of the following specific states as $a_n = 1$.

Thus because the limit is between 0 and infinity, a_n and b_n must both converge or diverge.

Because we know that a_n converges by the p-test for series, then b_n must converge.

Therefore the original series converges absolutely.

(c)
$$\sum_{n=1}^{\infty} (1 + \frac{1}{n})^{n^2}$$

For a series $\sum a_n$ to converge the $\lim_{n\to\infty} a_n$ must equal 0.

If we observe the exponentiated portion of the series $1 + \frac{1}{n}$ will always be strictly greater than 1 for $n \ge 1$. Thus the quantity being exponentiated, let's call it γ , will always be strictly greater than 1 for $n \ge 1$ and

will equal 1 at the limit.

Because $n \ge 1$ the exponent term n^2 will be a positive, increasing quantity.

$$\lim_{n\to\infty} \gamma \to 1$$
$$\lim_{n\to\infty} \gamma^{n^2} \to 1$$

$$\lim_{n\to\infty} \gamma^{n^2} \to 1$$

Because the sequence $\lim a_{n\to\infty} \neq 0 \implies \Sigma a_n$ does not converge. (d) $\sum_{n=1}^{\infty} \left(\frac{1}{2n-1} - \frac{1}{2n}\right) = \sum_{n=1}^{\infty} \left(\frac{2n}{2n(2n-1)} - \frac{2n-1}{(2n-1)(2n)}\right)$

(d)
$$\sum_{n=1}^{\infty} (\frac{1}{2n-1} - \frac{1}{2n})$$

$$= \sum_{n=1}^{\infty} \left(\frac{2n}{2n(2n-1)} - \frac{2n-1}{(2n-1)(2n)} \right)$$

$$= \sum_{n=1}^{\infty} \frac{-1}{4n^2 - 2n}$$

 $= \sum_{n=1}^{\infty} \frac{-1}{4n^2 - 2n}$ For ease of convergence proofing purposes I multiply by the constant -1. $= \sum_{n=1}^{\infty} \frac{1}{4n^2 - 2n}$ I will use the Limit Comparison Test to prove convergence:
Let $a_n = \frac{1}{n^2}$ and $b_n = \frac{1}{4n^2 - 2n}$ $\lim_{n \to \infty} \frac{a_n}{b_n} = \frac{\frac{1}{n^2}}{\frac{1}{4n^2 - 2n}} = \frac{4n^2 - 2n}{n^2}$ Using L'Hospitals: $L'(\frac{4n^2 - 2n}{n^2}) = \frac{8n - 2}{2n}$ $L'' = \frac{8}{2} = 4$ Because this is a constant between 0 and infinity, then both a_n and b_n my

$$=\sum_{n=1}^{\infty} \frac{1}{4n^2-2n}$$

Let
$$a_n = \frac{1}{n^2}$$
 and $b_n = \frac{1}{4n^2 - 2n}$

$$\lim_{n \to \infty} \frac{a_n}{b_n} = \frac{\frac{1}{n^2}}{\frac{1}{4n^2 - 2n}} = \frac{4n^2 - 2n}{n^2}$$

$$L'(\frac{4n^2-2n}{n^2}) = \frac{8n-2}{2n}$$

$$L''' = \frac{8}{2} = 4$$

Because this is a constant between 0 and infinity, then both a_n and b_n must converge or diverge.

Because a_n converges by the p-test for series, b_n must also converge, which means the original series
